

# **ADJUST-A-BAR**

## **Series TB7000**

The Edwards Adjust-A-Bar now enables you to change the width of your tool bar while moving down the row. This adjustment makes it possible for you to re-position tools to compensate for changing row widths and results in more accurate tool location. Fewer trips down each row means a saving in man hours and tractor hours. Making turns in restricted headlands is made easier by narrowing the Adjust-A-Bar at the end of each row. An optional stationary tool bar can be mounted behind the Adjust-A-Bar for fixed tools like cultivator shovels or ditchers.

- Adjusts width of tool bar mounted tools to enable working both sides of a row in a single pass.
- Attaches quickly and easily to tractor 3-point hitch or the Edwards Front Mount 3-Point Hitch.
- Adjust-A-Bar width controlled by one tractor remote valve.
- Two cylinders move bars equally outward from centerline of tractor.
- Saves man hours and tractor hours.
- Optional tool bar behind Adjust-A-Bar carries fixed tools and increases efficiency.
- Adjusts width over a range of 44 inches.
- Compliments use of Edwards Brush Spider in berry fields and vineyards.
